

What. a. Shame!

Suppose we could only take items in order

$dp[i][k] = \text{max gain if take items } 1 \dots i$
and host discards k times in total

$$dp[i][k] = \min \left(\overset{\text{discard}}{dp[i-1][k-1]}, dp[i-1][k] + v[i] \right) - c[i]$$

$\left[\begin{array}{l} \text{Take} \\ \text{Ignore} \end{array} \right] = \begin{array}{l} \text{Min} \\ \text{Max} \end{array} \left(\begin{array}{l} dp[i-1][k-1] - c[i] \\ dp[i-1][k] - c[i] + v[i] \end{array} \right)$

Shame Congratulations

Optimal order?

Observation: You want to take the items in increasing order of value!

Sort items by ascending order of value
Run our original DP!

$$Ans = dp[N][K]$$

Outer Space Invaders

Minimise sum of heights of attacks

$$n \leq 300$$

times, heights $\leq 10^4$

$dp[l][r]$ = Optimal answer for aliens completely in range $[l, r]$

$O(n) \rightarrow$ which ranges

Try each of the $O(n)$ starting points as our attack

→ Hit everything that intersects
 $dp(l)[m-1]$ $dp[m](r)$
